

## Audio Applications

### MEMBRANES / FILM CAPACITORS USING GOLD, COPPER OR SILVER

Many customised Steinerfilm products metallized for polymer film capacitors use zinc or aluminium as the electrode material. There are also additional applications that use more exotic metals as the electrical conducting layer.

gold metallized film for highest  
technical requirements

Steinerfilm, after metallizing and slitting,  
can be further processed into  
membranes for example

Certain audio applications, for instance, require the deposition of higher electrical conductivity such as gold whilst other coatings are often used for additional products like sensors and detectors.
